

# Package ‘admiralped’

January 16, 2025

**Type** Package

**Title** Pediatrics Extension Package for ADaM in 'R' Asset Library

**Version** 0.2.0

**Description** A toolbox for programming Clinical Data Standards Interchange Consortium (CDISC) compliant Analysis Data Model (ADaM) datasets in R. ADaM datasets are a mandatory part of any New Drug or Biologics License Application submitted to the United States Food and Drug Administration (FDA). Analysis derivations are implemented in accordance with the “Analysis Data Model Implementation Guide” (CDISC Analysis Data Model Team, 2021, <<https://www.cdisc.org/standards/foundational/adam>>). The package is an extension package of the 'admiral' package for pediatric clinical trials.

**License** Apache License (>= 2)

**URL** <https://pharmaverse.github.io/admiralped/>,  
<https://github.com/pharmaverse/admiralped>

**Depends** R (>= 4.1)

**Imports** admiral (>= 1.0.0), admiraldev (>= 1.0.0), cli (>= 3.6.2),  
dplyr (>= 1.0.5), magrittr (>= 1.5), purrr (>= 0.3.3), rlang  
(>= 0.4.4), tidyselect (>= 1.1.0), zoo (>= 1.8.12)

**Suggests** knitr, lubridate (>= 1.7.4), pharmaversesdtm (>= 1.1.0),  
rmarkdown, stringr (>= 1.4.0), testthat (>= 3.0.0), tibble

**VignetteBuilder** knitr

**Config/testthat/edition** 3

**Encoding** UTF-8

**Language** en-US

**LazyData** true

**RoxygenNote** 7.3.2

**NeedsCompilation** no

**Author** Fanny Gautier [aut, cre],  
 Ross Farrugia [aut],  
 Zelos Zhu [aut],  
 Sukalpo Saha [aut],  
 Lina Patil [aut],  
 Samia Kabi [aut],  
 Laura Liao [ctb],

---

adsl_peds	<i>Subject Level Analysis Dataset-pediatrics</i>
-----------	--

---

**Description**

An updated ADaM ADSL dataset with pediatric patients

**Usage**

adsl\_peds

**Format**

An object of class tbl\_df (inherits from tbl, data.frame) with 5 rows and 35 columns.

---

cdc_bmiage	<i>CDC BMI-for-age-chart</i>
------------	------------------------------

---

**Description**

BMI-for-age charts, 2 to 20.5 years

**Usage**

cdc\_bmiage

**Format**

A data frame with 438 rows and 7 variables:

SEX Sex: 1 = male, 2 = female

AGE Age in months

L Box-Cox transformation for normality

M Median

S Coefficient of variation

Sigma Sigma

P95 95th Percentile

**Source**

[https://www.cdc.gov/growthcharts/percentile\\_data\\_files.htm](https://www.cdc.gov/growthcharts/percentile_data_files.htm)

cdc\_htage

*CDC Height-for-age-chart*

---

**Description**

Height-for-age charts, 2 to 20 years

**Usage**

cdc\_htage

**Format**

A data frame with 436 rows and 5 variables:

SEX Sex: 1 = male, 2 = female

AGE Age in months

L Box-Cox transformation for normality

M Median

S Coefficient of variation

**Source**

`derive_interp_records` *Derive interpolated rows for the CDC charts (>=2 yrs old)*

---

**Description**

Derive a linear interpolation of rows for the CDC charts (>=2 yrs old) by age in days for the following parameters: HEIGHT, WEIGHT and BMI

**Usage**

```
derive_interp_records(dataset, by_vars = NULL, parameter)
```

**Arguments**

<code>dataset</code>	Input metadataset The variables AGE, AGEU, SEX, L, M, S are expected to be in the dataset For BMI the additional variables P95 and Sigma are expected to be in the dataset Note that AGE must be in days so that AGEU is equal to "DAYS"
<code>by_vars</code>	Grouping variables The variable from dataset which identifies the group of observations to interpolate separately.
<code>parameter</code>	CDC/WHO metadata parameter <i>Permitted Values:</i> "WEIGHT", "HEIGHT" or "BMI" only - Must not be NULL e.g. <code>parameter = "WEIGHT"</code> , <code>parameter = "HEIGHT"</code> , or <code>parameter = "BMI"</code> .

**Value**

The input dataset plus additional interpolated records: a record for each day from the minimum age to the maximum age.

If any variables in addition to the expected ones are in the input dataset, LOCF (Last Observation Carried Forward) is applied to populate them for the new records.

**See Also**

Metadata [cdc\\_bmiage](#), [cdc\\_htage](#), [cdc\\_wtage](#), [who\\_bmi\\_for\\_age\\_boys](#), [who\\_bmi\\_for\\_age\\_girls](#), [who\\_hc\\_for\\_age\\_boys](#), [who\\_hc\\_for\\_age\\_girls](#), [who\\_lgth\\_ht\\_for\\_age\\_boys](#), [who\\_lgth\\_ht\\_for\\_age\\_girls](#), [who\\_wt\\_for\\_age\\_boys](#), [who\\_wt\\_for\\_age\\_girls](#), [who\\_wt\\_for\\_lgth\\_boys](#), [who\\_wt\\_for\\_lgth\\_girls](#)

**Examples**

```
library(dplyr, warn.conflicts = FALSE)
library(rlang, warn.conflicts = FALSE)

cdc_htage <- admiralped::cdc_htage %>%
  mutate(
    SEX = case_when(
      SEX == 1 ~ "M",
      SEX == 2 ~ "F",
      TRUE ~ NA_character_
    ),
    # Ensure first that Age unit is "DAYS"
    AGE = round(AGE * 30.4375),
    AGEU = "DAYS"
  )

# Interpolate the AGE by SEX
derive_interp_records(
  dataset = cdc_htage,
  by_vars = exprs(SEX),
  parameter = "HEIGHT"
)
```

---

derive\_params\_growth\_age

*Derive Anthropometric indicators (Z-Scores/Percentiles-for-Age)  
based on Standard Growth Charts*

---

**Description**

Derive Anthropometric indicators (Z-Scores/Percentiles-for-Age) based on Standard Growth Charts for Height/Weight/BMI/Head Circumference by Age

**Usage**

```

derive_params_growth_age(
  dataset,
  sex,
  age,
  age_unit,
  meta_criteria,
  parameter,
  analysis_var,
  bmi_cdc_correction = FALSE,
  who_correction = FALSE,
  set_values_to_sds = NULL,
  set_values_to_pctl = NULL
)

```

**Arguments**

dataset	<p>Input dataset</p> <p>The variables specified in sex, age, age_unit, parameter, analysis_var are expected to be in the dataset.</p>
sex	<p>Sex</p> <p>A character vector is expected.</p> <p>Expected Values: M, F</p>
age	<p>Current Age</p> <p>A numeric vector is expected. Note that this is the actual age at the current visit.</p>
age_unit	<p>Age Unit A character vector is expected.</p> <p>Expected values: days, weeks, months</p>
meta_criteria	<p>Metadata dataset</p> <p>A metadata dataset with the following expected variables: AGE, AGEU, SEX, L, M, S</p> <p>The dataset can be derived from CDC/WHO or user-defined datasets. The CDC/WHO growth chart metadata datasets are available in the package and will require small modifications.</p> <p>If the age value from dataset falls between two AGE values in meta_criteria, then the L/M/S values that are chosen/mapped will be the AGE that has the smaller absolute difference to the value in age. e.g. If dataset has a current age of 27.49 months, and the metadata contains records for 27 and 28 months, the L/M/S corresponding to the 27 months record will be used.</p> <ul style="list-style-type: none"> <li>• AGE - Age</li> <li>• AGEU - Age Unit</li> <li>• SEX - Sex</li> <li>• L - Power in the Box-Cox transformation to normality</li> <li>• M - Median</li> <li>• S - Coefficient of variation</li> </ul>

parameter	<p>Anthropometric measurement parameter to calculate z-score or percentile</p> <p>A condition is expected with the input dataset VSTESTCD/PARAMCD for which we want growth derivations:</p> <p>e.g. parameter = VSTESTCD == "WEIGHT".</p> <p>There is CDC/WHO metadata available for Height, Weight, BMI, and Head Circumference available in the admiralpeds package.</p>
analysis_var	<p>Variable containing anthropometric measurement</p> <p>A numeric vector is expected, e.g. AVAL, VSSTRESN</p>
bmi_cdc_correction	<p>Extended CDC BMI-for-age correction</p> <p>A logical scalar, e.g. TRUE/FALSE is expected. CDC developed extended percentiles (&gt;95%) to monitor high BMI values, if set to TRUE the CDC's correction is applied.</p>
who_correction	<p>WHO adjustment for weight-based indicators</p> <p>A logical scalar, e.g. TRUE/FALSE is expected. WHO constructed a restricted application of the LMS method for weight-based indicators. More details on these exact rules applied can be found at the document page 302 of the <a href="#">WHO Child Growth Standards Guidelines</a>. If set to TRUE the WHO correction is applied.</p>
set_values_to_sds	<p>Variables to be set for Z-Scores</p> <p>The specified variables are set to the specified values for the new observations. For example, set_values_to_sds(exprs(PARAMCD = "BMIASDS", PARAM = "BMI-for-age z-score")) defines the parameter code and parameter.</p> <p>The formula to calculate the Z-score is as follows:</p> $\frac{\left(\left(\frac{obs}{M}\right)^L - 1\right)}{L * S}$ <p>where "obs" is the observed value for the respective anthropometric measure being calculated.</p> <p><i>Permitted Values:</i> List of variable-value pairs</p> <p>If left as default value, NULL, then parameter not derived in output dataset</p>
set_values_to_pctl	<p>Variables to be set for Percentile</p> <p>The specified variables are set to the specified values for the new observations. For example, set_values_to_pctl(exprs(PARAMCD = "BMIAPCTL", PARAM = "BMI-for-age percentile")) defines the parameter code and parameter.</p> <p><i>Permitted Values:</i> List of variable-value pair</p> <p>If left as default value, NULL, then parameter not derived in output dataset</p>

### Value

The input dataset additional records with the new parameter added.

  height,
  height_unit,
  meta_criteria,

```

```

parameter,
analysis_var,
who_correction = FALSE,
set_values_to_sds = NULL,
set_values_to_pctl = NULL
)

```

## Arguments

dataset	<p>Input dataset</p> <p>The variables specified in sex, height, height_unit, parameter, analysis_var are expected to be in the dataset.</p>
sex	<p>Sex</p> <p>A character vector is expected.</p> <p>Expected Values: M, F</p>
height	<p>Current Height/length</p> <p>A numeric vector is expected. Note that this is the actual height/length at the current visit.</p>
height_unit	<p>Height/Length Unit A character vector is expected.</p> <p>Expected values: cm</p>
meta_criteria	<p>Metadata dataset</p> <p>A metadata dataset with the following expected variables: HEIGHT_LENGTH, HEIGHT_LENGTHU, SEX, L, M, S</p> <p>The dataset can be derived from WHO or user-defined datasets. The WHO growth chart metadata datasets are available in the package and will require small modifications.</p> <p>Datasets who_wt_for_lgth_boys/who_wt_for_lgth_girls are applicable for subject age &lt; 730.5 days.</p> <p>If the height value from dataset falls between two HEIGHT_LENGTH values in meta_criteria, then the L/M/S values that are chosen/mapped will be the HEIGHT_LENGTH that has the smaller absolute difference to the value in height. e.g. If dataset has a current age of 50.49 cm, and the metadata contains records for 50 and 51 cm, the L/M/S corresponding to the 50 cm record will be used.</p> <ul style="list-style-type: none"> <li>• HEIGHT_LENGTH - Height/Length</li> <li>• HEIGHT_LENGTHU - Height/Length Unit</li> <li>• SEX - Sex</li> <li>• L - Power in the Box-Cox transformation to normality</li> <li>• M - Median</li> <li>• S - Coefficient of variation</li> </ul>
parameter	<p>Anthropometric measurement parameter to calculate z-score or percentile</p> <p>A condition is expected with the input dataset VSTESTCD/PARAMCD for which we want growth derivations:</p> <p>e.g. parameter = VSTESTCD == "WEIGHT".</p> <p>There is WHO metadata available for Weight available in the admiralped package. Weight measures are expected to be in the unit "kg".</p>

- analysis\_var** Variable containing anthropometric measurement  
A numeric vector is expected, e.g. AVAL, VSSTRESN
- who\_correction** WHO adjustment for weight-based indicators  
A logical scalar, e.g. TRUE/FALSE is expected. WHO constructed a restricted application of the LMS method for weight-based indicators. More details on these exact rules applied can be found at the document page 302 of the [WHO Child Growth Standards Guidelines](#). If set to TRUE the WHO correction is applied.
- set\_values\_to\_sds**  
Variables to be set for Z-Scores  
The specified variables are set to the specified values for the new observations. For example, `set_values_to_sds(exprs(PARAMCD = "WGTHSDS", PARAM = "Weight-for-height z-score"))` defines the parameter code and parameter.  
The formula to calculate the Z-score is as follows:
- $$\frac{\left(\left(\frac{obs}{M}\right)^L - 1\right)}{L * S}$$
- where "obs" is the observed value for the respective anthropometric measure being calculated.  
*Permitted Values:* List of variable-value pairs  
If left as default value, NULL, then parameter not derived in output dataset
- set\_values\_to\_pctl**  
Variables to be set for Percentile  
The specified variables are set to the specified values for the new observations. For example, `set_values_to_pctl(exprs(PARAMCD = "WGTHPCTL", PARAM = "Weight-for-height percentile"))` defines the parameter code and parameter.  
*Permitted Values:* List of variable-value pair  
If left as default value, NULL, then parameter not derived in output dataset

**Value**

The input dataset additional records with the new parameter added.

---

who\_hc\_for\_age\_girls *WHO Head circumference-for-age for girls*

---

**Description**

WHO Head circumference-for-age charts for girls from day 0 (birth) to day 1856

**Usage**

```
who_hc_for_age_girls
```

**Format**

A data frame with 1857 rows and 4 variables:

Day integer Age in days

L double Box-Cox transformation for normality

M double Median

S double Coefficient of variation

**Source**

<https://www.who.int/toolkits/child-growth-standards/standards/head-circumference-for-age>
