## Package 'paws.application.integration'

May 10, 2024

Title 'Amazon Web Services' Application Integration Services

Version 0.6.0

**Description** Interface to 'Amazon Web Services' application integration services, including 'Simple Queue Service' ('SQS') message queue, 'Simple Notification Service' ('SNS') publish/subscribe messaging, and more <a href="https://aws.amazon.com/">https://aws.amazon.com/</a>>.

## **Description**

Amazon EventBridge helps you to respond to state changes in your Amazon Web Services resources. When your resources change state, they automatically send events to an event stream. You can create rules that match selected events in the stream and route them to targets to take action. You can also use rules to take action on a predetermined schedule. For example, you can configure rules to:

- Automatically invoke an Lambda function to update DNS entries when an event notifies you that Amazon EC2 instance enters the running state.
- Direct specific API records from CloudTrail to an Amazon Kinesis data stream for detailed analysis of potential security or availability risks.
- Periodically invoke a built-in target to create a snapshot of an Amazon EBS volume.

For more information about the features of Amazon EventBridge, see the Amazon EventBridge User Guide.

#### Usage

```
eventbridge(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

#### **Arguments**

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
  - creds:
    - \* access\_key\_id: AWS access key ID
    - \* secret\_access\_key: AWS secret access key
    - \* session\_token: AWS temporary session token
  - profile: The name of a profile to use. If not given, then the default profile is used.
  - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close\_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3\_force\_path\_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts\_regional\_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

#### credentials

Optional credentials shorthand for the config parameter

- creds:
  - access\_key\_id: AWS access key ID
  - secret\_access\_key: AWS secret access key
  - session\_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

#### Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

#### **Service syntax**

```
svc <- eventbridge(</pre>
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
  endpoint = "string",
  region = "string"
)
```

## **Operations**

activate\_event\_source
cancel\_replay
create\_api\_destination
create\_archive
create\_connection
create\_endpoint
create\_event\_bus
create\_partner\_event\_source
deactivate\_event\_source
deauthorize\_connection
delete\_api\_destination
delete\_archive
delete\_connection
delete\_endpoint

Activates a partner event source that has been deactivated

Cancels the specified replay

Creates an API destination, which is an HTTP invocation endpoint configured as a target

Creates an archive of events with the specified settings

Creates a connection Creates a global endpoint

Creates a new event bus within your account

Called by an SaaS partner to create a partner event source

You can use this operation to temporarily stop receiving events from the specified partners

Removes all authorization parameters from the connection

Deletes the specified API destination

Deletes the specified archive

Deletes a connection

Delete an existing global endpoint

delete\_event\_bus Deletes the specified custom event bus or partner event bus

delete\_partner\_event\_source This operation is used by SaaS partners to delete a partner event source

delete\_rule Deletes the specified rule

describe\_api\_destination Retrieves details about an API destination

describe\_archive Retrieves details about an archive  $describe\_connection$ Retrieves details about a connection

describe\_endpoint Get the information about an existing global endpoint describe\_event\_bus Displays details about an event bus in your account

describe\_event\_source This operation lists details about a partner event source that is shared with your account describe\_partner\_event\_source An SaaS partner can use this operation to list details about a partner event source that the

describe\_replay Retrieves details about a replay describe\_rule Describes the specified rule disable\_rule Disables the specified rule enable\_rule Enables the specified rule

list\_api\_destinations Retrieves a list of API destination in the account in the current Region

list\_archives Lists your archives

list\_connections Retrieves a list of connections from the account List the global endpoints associated with this account list\_endpoints

Lists all the event buses in your account, including the default event bus, custom event bus all the event buses in your account, including the default event bus, custom event bus all the event buses in your account, including the default event bus, custom event bus all the event b list\_event\_buses

list\_event\_sources You can use this to see all the partner event sources that have been shared with your An

list\_partner\_event\_source\_accounts An SaaS partner can use this operation to display the Amazon Web Services account ID

list\_partner\_event\_sources An SaaS partner can use this operation to list all the partner event source names that the

Lists your replays list\_replays

Lists the rules for the specified target list\_rule\_names\_by\_target Lists your Amazon EventBridge rules list rules

list\_tags\_for\_resource Displays the tags associated with an EventBridge resource

list\_targets\_by\_rule Lists the targets assigned to the specified rule

Sends custom events to Amazon EventBridge so that they can be matched to rules put\_events This is used by SaaS partners to write events to a customer's partner event bus put\_partner\_events

Running PutPermission permits the specified Amazon Web Services account or Amazo put\_permission

Creates or updates the specified rule put\_rule

Adds the specified targets to the specified rule, or updates the targets if they are already put\_targets remove\_permission Revokes the permission of another Amazon Web Services account to be able to put ever

Removes the specified targets from the specified rule remove\_targets

Starts the specified replay start\_replay

Assigns one or more tags (key-value pairs) to the specified EventBridge resource tag\_resource

test\_event\_pattern Tests whether the specified event pattern matches the provided event Removes one or more tags from the specified EventBridge resource untag\_resource

update\_api\_destination Updates an API destination update\_archive Updates the specified archive update\_connection Updates settings for a connection Update an existing endpoint update\_endpoint

## **Examples**

## Not run:

svc <- eventbridge()</pre>

6 eventbridgepipes

```
svc$activate_event_source(
  Foo = 123
)
## End(Not run)
```

eventbridgepipes

Amazon EventBridge Pipes

#### **Description**

Amazon EventBridge Pipes connects event sources to targets. Pipes reduces the need for specialized knowledge and integration code when developing event driven architectures. This helps ensures consistency across your company's applications. With Pipes, the target can be any available EventBridge target. To set up a pipe, you select the event source, add optional event filtering, define optional enrichment, and select the target for the event data.

#### Usage

```
eventbridgepipes(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

#### **Arguments**

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
  - creds:
    - \* access\_key\_id: AWS access key ID
    - \* secret\_access\_key: AWS secret access key
    - \* **session\_token**: AWS temporary session token
  - **profile**: The name of a profile to use. If not given, then the default profile is used.
  - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close\_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3\_force\_path\_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.

eventbridgepipes 7

• sts\_regional\_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- creds
  - access\_key\_id: AWS access key ID
  - secret\_access\_key: AWS secret access key
  - session\_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

#### Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

#### Service syntax

```
svc <- eventbridgepipes(</pre>
 config = list(
   credentials = list(
     creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
     ),
     profile = "string",
     anonymous = "logical"
   ),
   endpoint = "string",
   region = "string",
   close_connection = "logical",
    timeout = "numeric",
   s3_force_path_style = "logical",
   sts_regional_endpoint = "string"
  ),
  credentials = list(
   creds = list(
     access_key_id = "string",
     secret_access_key = "string",
     session_token = "string"
   profile = "string",
```

eventbridgescheduler

```
anonymous = "logical"
),
endpoint = "string",
region = "string"
)
```

## **Operations**

8

create\_pipe Create a pipe delete\_pipe Delete an existing pipe describe\_pipe Get the information about an existing pipe list\_pipes Get the pipes associated with this account Displays the tags associated with a pipe list\_tags\_for\_resource Start an existing pipe start\_pipe stop\_pipe Stop an existing pipe tag\_resource Assigns one or more tags (key-value pairs) to the specified pipe Removes one or more tags from the specified pipes untag\_resource update\_pipe Update an existing pipe

## **Examples**

```
## Not run:
svc <- eventbridgepipes()
svc$create_pipe(
  Foo = 123
)
## End(Not run)</pre>
```

eventbridgescheduler Amazon EventBridge Scheduler

## **Description**

Amazon EventBridge Scheduler is a serverless scheduler that allows you to create, run, and manage tasks from one central, managed service. EventBridge Scheduler delivers your tasks reliably, with built-in mechanisms that adjust your schedules based on the availability of downstream targets. The following reference lists the available API actions, and data types for EventBridge Scheduler.

## Usage

```
eventbridgescheduler(
  config = list(),
  credentials = list(),
```

eventbridgescheduler 9

```
endpoint = NULL,
region = NULL
)
```

#### **Arguments**

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
  - creds:
    - \* access\_key\_id: AWS access key ID
    - \* secret\_access\_key: AWS secret access key
    - \* session\_token: AWS temporary session token
  - **profile**: The name of a profile to use. If not given, then the default profile is used.
  - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close\_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3\_force\_path\_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts\_regional\_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e

#### credentials

Optional credentials shorthand for the config parameter

- creds:
  - access\_key\_id: AWS access key ID
  - secret\_access\_key: AWS secret access key
  - session\_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

#### Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

#### Service syntax

```
svc <- eventbridgescheduler(</pre>
  config = list(
   credentials = list(
     creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
     ),
     profile = "string",
     anonymous = "logical"
   ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
   sts_regional_endpoint = "string"
  ),
  credentials = list(
   creds = list(
     access_key_id = "string",
     secret_access_key = "string",
     session_token = "string"
   ),
   profile = "string",
   anonymous = "logical"
  endpoint = "string",
  region = "string"
)
```

## **Operations**

create\_schedule Creates the specified schedule create\_schedule\_group Creates the specified schedule group Deletes the specified schedule delete schedule delete\_schedule\_group Deletes the specified schedule group Retrieves the specified schedule get schedule get\_schedule\_group Retrieves the specified schedule group Returns a paginated list of your schedule groups list\_schedule\_groups list\_schedules Returns a paginated list of your EventBridge Scheduler schedules list\_tags\_for\_resource Lists the tags associated with the Scheduler resource Assigns one or more tags (key-value pairs) to the specified EventBridge Scheduler resource tag\_resource untag resource Removes one or more tags from the specified EventBridge Scheduler schedule group Updates the specified schedule update\_schedule

locationservice 11

## **Examples**

```
## Not run:
svc <- eventbridgescheduler()
svc$create_schedule(
   Foo = 123
)
## End(Not run)</pre>
```

locationservice

Amazon Location Service

#### **Description**

"Suite of geospatial services including Maps, Places, Routes, Tracking, and Geofencing"

## Usage

```
locationservice(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

## **Arguments**

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
  - creds:
    - \* access\_key\_id: AWS access key ID
    - \* secret\_access\_key: AWS secret access key
    - \* session\_token: AWS temporary session token
    - profile: The name of a profile to use. If not given, then the default profile is used.
    - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close\_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.

12 locationservice

- **s3\_force\_path\_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts\_regional\_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials

Optional credentials shorthand for the config parameter

- · creds:
  - access\_key\_id: AWS access key ID
  - secret\_access\_key: AWS secret access key
  - session\_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

#### Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

#### Service syntax

```
svc <- locationservice(</pre>
 config = list(
   credentials = list(
     creds = list(
        access_key_id = "string",

mq

AmazonMQ

## Description

Amazon MQ is a managed message broker service for Apache ActiveMQ and RabbitMQ that makes it easy to set up and operate message brokers in the cloud. A message broker allows software applications and components to communicate using various programming languages, operating systems, and formal messaging protocols.

#### Usage

```
mq(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

mq 15

#### Arguments

config Optional configuration of credentials, endpoint, and/or region.

- · credentials:
  - creds:
    - \* access\_key\_id: AWS access key ID
    - \* secret\_access\_key: AWS secret access key
    - \* session\_token: AWS temporary session token
  - profile: The name of a profile to use. If not given, then the default profile is used.
  - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close\_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3\_force\_path\_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts\_regional\_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials Optional credentials shorthand for the config parameter

- · creds:
  - access\_key\_id: AWS access key ID
  - secret\_access\_key: AWS secret access key
  - session\_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

## Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

## Service syntax

```
svc <- mq(
  config = list(
    credentials = list(
    creds = list(
    access_key_id = "string",</pre>
```

16 mq

```
secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",

#### Regions

For a list of supported regions, see Amazon MWAA endpoints and quotas in the Amazon Web Services General Reference.

18 mwaa

#### **Usage**

```
mwaa(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

## **Arguments**

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
  - creds:
    - \* access\_key\_id: AWS access key ID
    - \* secret\_access\_key: AWS secret access key
    - \* session\_token: AWS temporary session token
  - profile: The name of a profile to use. If not given, then the default profile is used.
  - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close\_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3\_force\_path\_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts\_regional\_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

#### credentials

Optional credentials shorthand for the config parameter

- · creds:
  - access\_key\_id: AWS access key ID
  - secret\_access\_key: AWS secret access key
  - session\_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

#### Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

mwaa 19

#### **Service syntax**

```
svc <- mwaa(
  config = list(
   credentials = list(
     creds = list(
       access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
     ),
     profile = "string",
     anonymous = "logical"
   ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
   sts_regional_endpoint = "string"
  ),
  credentials = list(
   creds = list(
     access_key_id = "string",
     secret_access_key = "string",
     session_token = "string"
   ),
   profile = "string",
   anonymous = "logical"
  endpoint = "string",
  region = "string"
)
```

## **Operations**

create\_cli\_token

#### **Examples**

```
## Not run:
svc <- mwaa()
svc$create_cli_token(
  Foo = 123
)
## End(Not run)</pre>
```

resourceexplorer

AWS Resource Explorer

## Description

Amazon Web Services Resource Explorer is a resource search and discovery service. By using Resource Explorer, you can explore your resources using an internet search engine-like experience. Examples of resources include Amazon Relational Database Service (Amazon RDS) instances, Amazon Simple Storage Service (Amazon S3) buckets, or Amazon DynamoDB tables. You can search for your resources using resource metadata like names, tags, and IDs. Resource Explorer can search across all of the Amazon Web Services Regions in your account in which you turn the service on, to simplify your cross-Region workloads.

Resource Explorer scans the resources in each of the Amazon Web Services Regions in your Amazon Web Services account in which you turn on Resource Explorer. Resource Explorer creates and maintains an index in each Region, with the details of that Region's resources.

You can search across all of the indexed Regions in your account by designating one of your Amazon Web Services Regions to contain the aggregator index for the account. When you promote a local index in a Region to become the aggregator index for the account, Resource Explorer automatically replicates the index information from all local indexes in the other Regions to the aggregator index. Therefore, the Region with the aggregator index has a copy of all resource information for all Regions in the account where you turned on Resource Explorer. As a result, views in the aggregator index Region include resources from all of the indexed Regions in your account.

For more information about Amazon Web Services Resource Explorer, including how to enable and configure the service, see the Amazon Web Services Resource Explorer User Guide.

#### Usage

```
resourceexplorer(
  config = list(),
  credentials = list(),
  endpoint = NULL,
  region = NULL
)
```

resourceexplorer 21

#### **Arguments**

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
  - creds:
    - \* access\_key\_id: AWS access key ID
    - \* secret\_access\_key: AWS secret access key
    - \* session\_token: AWS temporary session token
  - profile: The name of a profile to use. If not given, then the default profile is used.
  - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close\_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3\_force\_path\_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts\_regional\_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

#### credentials

Optional credentials shorthand for the config parameter

- · creds:
  - access\_key\_id: AWS access key ID
  - secret\_access\_key: AWS secret access key
  - session\_token: AWS temporary session token
- profile: The name of a profile to use. If not given, then the default profile
  is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

## Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

## Service syntax

```
svc <- resourceexplorer(
  config = list(
    credentials = list(
    creds = list(
    access_key_id = "string",</pre>
```

22 resourceexplorer

```

## End(Not run)
```

sfn

AWS Step Functions

## **Description**

#### Step Functions

Step Functions is a service that lets you coordinate the components of distributed applications and microservices using visual workflows.

You can use Step Functions to build applications from individual components, each of which performs a discrete function, or *task*, allowing you to scale and change applications quickly. Step Functions provides a console that helps visualize the components of your application as a series of steps. Step Functions automatically triggers and tracks each step, and retries steps when there are errors, so your application executes predictably and in the right order every time. Step Functions logs the state of each step, so you can quickly diagnose and debug any issues.

Step Functions manages operations and underlying infrastructure to ensure your application is available at any scale. You can run tasks on Amazon Web Services, your own servers, or any system that has access to Amazon Web Services. You can access and use Step Functions using the console, the Amazon Web Services SDKs, or an HTTP API. For more information about Step Functions, see the *Step Functions Developer Guide*.

If you use the Step Functions API actions using Amazon Web Services SDK integrations, make sure the API actions are in camel case and parameter names are in Pascal case. For example, you could use Step Functions API action startSyncExecution and specify its parameter as StateMachineArn.

## Usage

```
sfn(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

#### **Arguments**

config

Optional configuration of credentials, endpoint, and/or region.

- · credentials:
  - creds:
    - \* access\_key\_id: AWS access key ID
    - \* secret\_access\_key: AWS secret access key
    - \* session\_token: AWS temporary session token
  - profile: The name of a profile to use. If not given, then the default profile is used.
  - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.

sfn 27

- close\_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3\_force\_path\_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts\_regional\_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials Optional credentials shorthand for the config parameter

- · creds:
  - access\_key\_id: AWS access key ID
  - secret\_access\_key: AWS secret access key
  - session\_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

#### Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

#### Service syntax

```
svc <- sfn(
 config = list(
   credentials = list(
     creds = list(
       access_key_id = "string",
       secret_access_key = "string",
       session_token = "string"
     ),

),
    endpoint = "string",
    region = "string"
```

#### **Operations**

create\_activity Creates an activity
create\_state\_machine Creates a state machine
create\_state\_machine\_alias
Creates an alias for a str

delete\_activityDeletes an activitydelete\_state\_machineDeletes a state machinedelete\_state\_machine\_aliasDeletes a state machine aliasdelete\_state\_machine\_versionDeletes a state machine version

delete\_state\_machine\_versionDeletes a state machine versiondescribe\_activityDescribes an activitydescribe\_executionProvides information about a state machine execution, such as the state machine associated as the state machine as the state mac

describe\_map\_run
Provides information about a Map Run's configuration, progress, and results
describe\_state\_machine
Provides information about a state machine's definition, its IAM role Amazon Resou

describe\_state\_machine\_alias Returns details about a state machine alias

describe\_state\_machine\_for\_execution get\_activity\_task

Provides information about a state machine's definition, its execution role ARN, and Used by workers to retrieve a task (with the specified activity ARN) which has been

get\_execution\_history Returns the history of the specified execution as a list of events

et\_execution\_mstory Returns the instory of the specified execution as a list of

list\_activities Lists the existing activities

list\_executions Lists all executions of a state machine or a Map Run

list\_map\_runs Lists all Map Runs that were started by a given state machine execution

list\_state\_machine\_aliases Lists aliases for a specified state machine ARN

list\_state\_machines Lists the existing state machines

lists\_state\_machine\_versions Lists versions for the specified state machine Amazon Resource Name (ARN)

list\_tags\_for\_resource List tags for a given resource

publish\_state\_machine\_version Creates a version from the current revision of a state machine

redrive\_execution
Restarts unsuccessful executions of Standard workflows that didn't complete success send\_task\_failure
Used by activity workers, Task states using the callback pattern, and optionally Task send\_task\_heartbeat
Used by activity workers and Task states using the callback pattern, and optionally Task used task\_success
Used by activity workers, Task states using the callback pattern, and optionally Task

start\_execution Starts a state machine execution

start\_sync\_execution Starts a Synchronous Express state machine execution

stop\_execution Stops an execution

tag\_resource Add a tag to a Step Functions resource

test\_state Accepts the definition of a single state and executes it

untag\_resource Remove a tag from a Step Functions resource

update\_map\_run Updates an in-progress Map Run's configuration to include changes to the settings the

sns 29

```
update_state_machine_alias
validate_state_machine_definition
```

Updates an existing state machine by modifying its definition, roleArn, or loggingCo Updates the configuration of an existing state machine alias by modifying its descrip Validates the syntax of a state machine definition

#### **Examples**

```
## Not run:
svc <- sfn()
svc$create_activity(
  Foo = 123
)
## End(Not run)</pre>
```

sns

Amazon Simple Notification Service

## **Description**

Amazon Simple Notification Service (Amazon SNS) is a web service that enables you to build distributed web-enabled applications. Applications can use Amazon SNS to easily push real-time notification messages to interested subscribers over multiple delivery protocols. For more information about this product see the Amazon SNS product page. For detailed information about Amazon SNS features and their associated API calls, see the Amazon SNS Developer Guide.

For information on the permissions you need to use this API, see <u>Identity and access management</u> in Amazon SNS in the *Amazon SNS Developer Guide*.

We also provide SDKs that enable you to access Amazon SNS from your preferred programming language. The SDKs contain functionality that automatically takes care of tasks such as: cryptographically signing your service requests, retrying requests, and handling error responses. For a list of available SDKs, go to Tools for Amazon Web Services.

#### Usage

```
sns(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

## Arguments

config

Optional configuration of credentials, endpoint, and/or region.

- credentials:
  - creds:
    - \* access\_key\_id: AWS access key ID
    - \* secret\_access\_key: AWS secret access key
    - \* session\_token: AWS temporary session token

30 sns

- profile: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close\_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3\_force\_path\_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts\_regional\_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

#### credentials

Optional credentials shorthand for the config parameter

- · creds:
  - access\_key\_id: AWS access key ID
  - secret\_access\_key: AWS secret access key
  - session\_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

#### Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

## Service syntax

```
svc <- sns(
  config = list(

Amazon Simple Queue Service

## Description

Welcome to the Amazon SQS API Reference.

Amazon SQS is a reliable, highly-scalable hosted queue for storing messages as they travel between applications or microservices. Amazon SQS moves data between distributed application components and helps you decouple these components.

For information on the permissions you need to use this API, see <u>Identity and access management</u> in the *Amazon SQS Developer Guide*.

You can use Amazon Web Services SDKs to access Amazon SQS using your favorite programming language. The SDKs perform tasks such as the following automatically:

- · Cryptographically sign your service requests
- · Retry requests
- · Handle error responses

#### Additional information

sqs

sqs 33

  - Regions and Endpoints

#### Usage

```
sqs(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

## **Arguments**

config Optional configuration of credentials, endpoint, and/or region.

- · credentials:
  - creds:
    - \* access\_key\_id: AWS access key ID
    - \* secret\_access\_key: AWS secret access key
    - \* session\_token: AWS temporary session token
  - profile: The name of a profile to use. If not given, then the default profile is used.
  - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close\_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3\_force\_path\_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts\_regional\_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials Optional credentials shorthand for the config parameter

- · creds:
  - access\_key\_id: AWS access key ID
  - secret\_access\_key: AWS secret access key
  - session\_token: AWS temporary session token
- **profile**: The name of a profile to use. If not given, then the default profile is used.
- anonymous: Set anonymous credentials.

endpoint Optional shorthand for complete URL to use for the constructed client. region Optional shorthand for AWS Region used in instantiating the client.

sqs

#### Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

#### Service syntax

```
svc <- sqs(</pre>
  config = list(
    credentials = list(
      creds = list(
        access_key_id = "string",
        secret_access_key = "string",
        session_token = "string"
      ),
      profile = "string",
      anonymous = "logical"
    ),
    endpoint = "string",
    region = "string",
    close_connection = "logical",
    timeout = "numeric",
    s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
    creds = list(
      access_key_id = "string",
      secret_access_key = "string",
      session_token = "string"
    ),
    profile = "string",
    anonymous = "logical"
  ),
  endpoint = "string",
  region = "string"
)
```

#### **Operations**

add\_permission
cancel\_message\_move\_task
change\_message\_visibility
change\_message\_visibility\_batch
create\_queue
delete\_message
delete\_message\_batch
delete\_queue

Adds a permission to a queue for a specific principal

Cancels a specified message movement task

Changes the visibility timeout of a specified message in a queue to a new value

Changes the visibility timeout of multiple messages

Creates a new standard or FIFO queue

Deletes the specified message from the specified queue Deletes up to ten messages from the specified queue

Deletes the queue specified by the QueueUrl, regardless of the queue's contents

get\_queue\_attributes
get\_queue\_url
list\_dead\_letter\_source\_queues
list\_message\_move\_tasks
list\_queues
list\_queue\_tags
purge\_queue
receive\_message
remove\_permission
send\_message
send\_message\_batch
set\_queue\_attributes
start\_message\_move\_task
tag\_queue
untag\_queue

Gets attributes for the specified queue

Returns the URL of an existing Amazon SQS queue

Returns a list of your queues that have the RedrivePolicy queue attribute configured with a Gets the most recent message movement tasks (up to 10) under a specific source queue

Returns a list of your queues in the current region

List all cost allocation tags added to the specified Amazon SQS queue

Deletes available messages in a queue (including in-flight messages) specified by the Que

Retrieves one or more messages (up to 10), from the specified queue

Revokes any permissions in the queue policy that matches the specified Label parameter

Delivers a message to the specified queue

You can use SendMessageBatch to send up to 10 messages to the specified queue by assig

Sets the value of one or more queue attributes

Starts an asynchronous task to move messages from a specified source queue to a specifie

Add cost allocation tags to the specified Amazon SQS queue

Remove cost allocation tags from the specified Amazon SQS queue

## Examples

```
## Not run:
svc <- sqs()
svc$add_permission(
  Foo = 123
)
## End(Not run)</pre>
```

Amazon Simple Workflow Service

swf

## Description

The Amazon Simple Workflow Service (Amazon SWF) makes it easy to build applications that use Amazon's cloud to coordinate work across distributed components. In Amazon SWF, a *task* represents a logical unit of work that is performed by a component of your workflow. Coordinating tasks in a workflow involves managing intertask dependencies, scheduling, and concurrency in accordance with the logical flow of the application.

Amazon SWF gives you full control over implementing tasks and coordinating them without worrying about underlying complexities such as tracking their progress and maintaining their state.

This documentation serves as reference only. For a broader overview of the Amazon SWF programming model, see the *Amazon SWF Developer Guide*.

## Usage

```
swf(config = list(), credentials = list(), endpoint = NULL, region = NULL)
```

#### **Arguments**

config Optional configuration of credentials, endpoint, and/or region.

- · credentials:
  - creds:
    - \* access\_key\_id: AWS access key ID
    - \* secret\_access\_key: AWS secret access key
    - \* session\_token: AWS temporary session token
  - **profile**: The name of a profile to use. If not given, then the default profile is used.
  - anonymous: Set anonymous credentials.
- endpoint: The complete URL to use for the constructed client.
- region: The AWS Region used in instantiating the client.
- close\_connection: Immediately close all HTTP connections.
- **timeout**: The time in seconds till a timeout exception is thrown when attempting to make a connection. The default is 60 seconds.
- **s3\_force\_path\_style**: Set this to true to force the request to use path-style addressing, i.e. http://s3.amazonaws.com/BUCKET/KEY.
- sts\_regional\_endpoint: Set sts regional endpoint resolver to regional or legacy https://docs.aws.amazon.com/sdkref/latest/guide/feature-sts-regionalized-e html

credentials Optional credentials shorthand for the config parameter

- · creds:
  - access\_key\_id: AWS access key ID
  - secret\_access\_key: AWS secret access key
  - session\_token: AWS temporary session token
- profile: The name of a profile to use. If not given, then the default profile
  is used.
- anonymous: Set anonymous credentials.

endpoint

Optional shorthand for complete URL to use for the constructed client.

region

Optional shorthand for AWS Region used in instantiating the client.

## Value

A client for the service. You can call the service's operations using syntax like svc\$operation(...), where svc is the name you've assigned to the client. The available operations are listed in the Operations section.

## Service syntax

```
svc <- swf(
  config = list(
    credentials = list(
    creds = list(
    access_key_id = "string",</pre>
```

```
secret_access_key = "string",
        session_token = "string"
     ),
     profile = "string";
     anonymous = "logical"
   ),
   endpoint = "string",
   region = "string",
   close_connection = "logical",
    timeout = "numeric",
   s3_force_path_style = "logical",
    sts_regional_endpoint = "string"
  ),
  credentials = list(
   creds = list(
     access_key_id = "string",
     secret_access_key = "string",
      session_token = "string"
   ),
   profile = "string",
   anonymous = "logical"
 endpoint = "string",
  region = "string"
)
```

## **Operations**

count\_closed\_workflow\_executions count\_open\_workflow\_executions count\_pending\_activity\_tasks count\_pending\_decision\_tasks deprecate\_activity\_type deprecate\_domain deprecate\_workflow\_type describe\_activity\_type describe\_domain describe\_workflow\_execution describe\_workflow\_type get\_workflow\_execution\_history list\_activity\_types list\_closed\_workflow\_executions list\_domains list\_open\_workflow\_executions list\_tags\_for\_resource list\_workflow\_types poll\_for\_activity\_task poll\_for\_decision\_task

Returns the number of closed workflow executions within the given domain that meet the Returns the number of open workflow executions within the given domain that meet the Returns the estimated number of activity tasks in the specified task list

Returns the estimated number of decision tasks in the specified task list

Deprecates the specified activity type

Deprecates the specified domain

Deprecates the specified workflow type

Returns information about the specified activity type

Returns information about the specified activity type

Returns information about the specified domain, including description and status

Returns information about the specified workflow execution including its type and some

Returns information about the specified workflow type

Returns the history of the specified workflow execution

Returns information about all activities registered in the specified domain that match the Returns a list of closed workflow executions in the specified domain that meet the filter

Returns the list of domains registered in the account

Returns a list of open workflow executions in the specified domain that meet the filtering

List tags for a given domain

Returns information about workflow types in the specified domain

Used by workers to get an ActivityTask from the specified activity taskList Used by deciders to get a DecisionTask from the specified decision taskList
